

Using the Test program to verify your solution

1. Download the files from the 'lab 1 Test Program' folder into your project folder. Replace the old 'Main.cpp' with the new one.
2. Refresh your project in Eclipse to make sure the new files are present

3. Launch the program 'MTTTY' and connect it to the board
4. Compile the project and download the code to the Netburner board. You might have to perform a 'clean' on the project if it didn't download correctly.
5. Using the Menu in 'MTTTY', select which program you would like to test. In the example below, you can only test one solution at a time. Select 1 to test part A. Verify your solution. Replace part A solution with part B. Repeat the above steps .
